

# 4.5V to 5.5V, 0.8A 1ch Synchronous Buck Converter with Integrated FET

# BD8967FVM

#### **General Description**

BD8967FVM is ROHM's high efficiency step-down switching regulator designed to produce a voltage as low as 3.3V from a supply voltage of 5V. It offers high efficiency with synchronous switches and provides fast transient response to sudden load changes by implementing current mode control.

#### Features

- Fast Transient Response because of Current Mode PWM Control System.
- High Efficiency for All Load Ranges with Synchronous Rectifier (Nch/Pch FET)
- Soft-Start Function.
- Thermal Shutdown and UVLO Functions.
- Short-Circuit Protection with Time Delay Function.
- Shutdown Function

### Application

Power Supply for LSI including DSP, Microcomputer and ASIC

# Key Specifications

Jecifications	
Input Voltage Range:	4.5V to 5.5V
Output Voltage Range:	3.3V±2%
Output Current:	0.8A (Max)
Switching Frequency:	1MHz (Typ)
Pch FET ON-Resistance:	350mΩ (Typ)
Nch FET ON-Resistance:	250mΩ (Typ)
Standby Current:	0µA (Typ)
Operating Temperature Depas	

Operating Temperature Range: -25°C to +85°C

### Package

#### W(Typ) x D(Typ) x H(Max)

# **Typical Application Circuit**

OProduct structure : Silicon monolithic integrated circuit O This product has no designed protection against radioactive rays

# **Pin Configuration**

## **Pin Description**

Pin No.	Pin Name	Function
1	VOUT	Output voltage detection pin
2	ITH	GmAmp output pin/connected to phase compensation capacitor
3	EN	Enable pin(Active High)
4	GND	Ground pin
5	PGND	Power switch ground pin
6	SW	Power switch node
7	PVCC	Power switch supply pin
8	VCC	Power supply input pin

# **Block Diagram**

Figure 3. Block Diagram

## **Absolute Maximum Ratings**

Parameter	Symbol	Rating	Unit
VCC Voltage	V <sub>CC</sub>	-0.3 to +7 <sup>(Note 1)</sup>	V
PVCC Voltage	PV <sub>CC</sub>	-0.3 to +7 <sup>(Note 1)</sup>	V
EN Voltage	$V_{\text{EN}}$	-0.3 to +7	V
SW , ITH Voltage	$V_{SW}, V_{ITH}$	-0.3 to +7	V
Power Dissipation 1	Pd1	0.38 <sup>(Note 2)</sup>	W
Power Dissipation 2	Pd2	0.58 <sup>(Note 3)</sup>	W
Operating Temperature Range	Topr	-25 to +85	°C
Storage Temperature Range	Tstg	-55 to +150	°C
Maximum Junction Temperature	Tjmax	+150	°C

(Note 1) Pd should not be exceeded.

(Note 1) Reduce by 3.1mW/°C for temperatures above Ta=25°C. (Note 3) Reduce by 4.7mW/°C for temperatures above Ta=25°C, when mounted on 1 layer 70mmx70mmx1.6mm Glass Epoxy PCB. **Caution:** Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

## **Recommended Operating Conditions** (Ta=25°C)

Deremeter	Symbol	Limit			Linit
Parameter		Min	Тур	Max	Unit
VCC Voltage	V <sub>CC</sub> (Note 4)	4.5	5.0	5.5	V
PVCC Voltage	PV <sub>CC</sub> (Note 4)	4.5	5.0	5.5	V
EN Voltage	V <sub>EN</sub>	0	-	V <sub>cc</sub>	V
SW Average Output Current	I <sub>SW</sub> (Note 4)	-	-	0.8	А

(Note 4) Pd should not be exceeded.

## Electrical Characteristics (Ta=25°C, V<sub>CC</sub>=5V, V<sub>EN</sub>=V<sub>CC</sub>, unless otherwise specified.)

Parameter	Symbol	Min	Тур	Max	Unit	Conditions
Standby Current	I <sub>STB</sub>	-	0	10	μA	EN=GND
Bias Current	Icc	-	250	450	μA	
EN Low Voltage	V <sub>ENL</sub>	-	GND	0.8	V	Standby mode
EN High Voltage	V <sub>ENH</sub>	2.0	V <sub>CC</sub>	-	V	Active mode
EN Input Current	I <sub>EN</sub>	-	1	10	μA	V <sub>EN</sub> =5V
Oscillation Frequency	f <sub>osc</sub>	0.8	1	1.2	MHz	
Pch FET ON-Resistance	RONP	-	350	600	mΩ	PV <sub>CC</sub> =5V
Nch FET ON-Resistance	R <sub>ONN</sub>	-	250	500	mΩ	PV <sub>CC</sub> =5V
Output Voltage	Vout	3.234	3.300	3.366	V	
ITH Sink Current	I <sub>THSI</sub>	10	20	-	μA	V <sub>ADJ</sub> =H
ITH Source Current	I <sub>THSO</sub>	10	20	-	μA	V <sub>ADJ</sub> =L
UVLO Threshold Voltage	V <sub>UVL01</sub>	3.90	4.10	4.30	V	V <sub>CC</sub> =4.5V to 0V
UVLO Release Voltage	$V_{UVLO2}$	3.95	4.20	4.50	V	V <sub>CC</sub> =0V to 4.5V
Soft Start Time	t <sub>ss</sub>	0.5	1	2	ms	
Timer Latch Time	t <sub>LATCH</sub>	0.5	1	2	ms

## **Application Information**

#### 1. Operation

BD8967FVM is a synchronous step-down switching regulator that achieves fast transient response by employing current mode PWM control system.

(1) Synchronous Rectifier

Integrated synchronous rectification using two MOSFETS reduces power dissipation and increases efficiency when compared to converters using external diodes. Internal shoot-through current limiting circuit further reduces power dissipation.

(2) Current Mode PWM Control

The PWM control signal of this IC depends on two feedback loops, the voltage feedback and the inductor current feedback.

(a) PWM (Pulse Width Modulation) Control

The clock signal coming from OSC has a frequency of 1Mhz. When OSC sets the RS latch, the P-Channel MOSFET is turned on and the N-Channel MOSFET is turned OFF. The opposite happens when the current comparator (Current Comp) resets the RS latch i.e. the P-Channel MOSFET is turned OFF and the N-Channel MOSFET is turned on. Current Comp's output is a comparison of two signals, the current feedback control signal "SENSE" which is a voltage proportional to the current  $I_L$ , and the voltage feedback control signal, FB.

Figure 19. PWM Switching Timing Diagram

## 2. Description of Functions

#### (1) Soft-Start Function

During start-up, the soft-start circuit gradually establishes the output voltage to limit the input current. This prevents the overshoot in the output voltage and inrush current.

(2) Shutdown Function

When EN terminal is "Low", the device operates in Standby Mode, and all functional blocks such as the reference voltage circuit, internal oscillator, and drivers, are turned OFF. Circuit current during standby is 0µA (Typ).

(3) UVLO Function

The UVLO circuit detects whether the supplied input voltage is sufficient to obtain the output voltage of this IC. The UVLO threshold has a hysteresis of 100mV (Typ) to prevent the output from chattering.

Figure 20. Soft-Start, Shutdown, UVLO Timing Diagram

(4) Short-Circuit Protection with Time Delay Function

To protect the IC from breakdown, the short-circuit protection turns the output OFF when the internal current limiter is activated continuously for at least 1 ms. The output that is held OFF may be turned ON again by restarting EN or by resetting UVLO.

#### 3. Information on Advantages

Advantage 1 : Offers fast transient response by using current mode control system

Figure 22. Comparison of Transient Response

Advantage 2 : Offers high efficiency because of synchronous rectifier

For heavier load: This IC utilizes synchronous rectifying mode and uses low ON-Resistance power MOSFETs.

ON-Resistance of P-Channel MOSFET: 350mΩ(Typ)  $\int ON$ -Resistance of N-Channel MOSFET: 250m $\Omega$ (Typ)

· Required output capacitor Co for current mode control: 10µF ceramic capacitor · Required inductance L for the operating frequency of 1 MHz: 4.7µH inductor

Advantage 3 : • Supplied in smaller package due to small-sized power MOSFET

## 4. Switching Regulator Efficiency

Efficiency  $\eta$  may be expressed by the equation shown below:

$$\eta = \frac{V_{OUT} \times I_{OUT}}{V_{IN} \times I_{IN}} \times 100 = \frac{P_{OUT}}{P_{IN}} \times 100 = \frac{P_{OUT}}{P_{OUT} + Pd\alpha} \times 100 \qquad [\%]$$

Efficiency may be improved by reducing the switching regulator power dissipation factors Pda as follows:

Dissipation factors:

(1) ON-Resistance Dissipation of Inductor and FET : Pd(I<sup>2</sup>R)

$$Pd(I^2R) = I_{OUT}^2 \times (R_{COIL} + R_{ON})$$

Where:  $R_{COIL}$  is the DC resistance of inductor  $R_{ON}$  is the ON-Resistance of FET  $I_{OUT}$  is the output current

(2) Gate Charge/Discharge Dissipation : Pd (Gate)

$$Pd(Gate) = C_{gs} \times f \times V^2$$

Where:  $C_{gs}$  is the gate capacitance of FET *f* is the switching frequency *V* is the gate driving voltage of FET

(3) Switching Dissipation : Pd(SW)

$$Pd(SW) = \frac{V_{IN}^{2} \times C_{RSS} \times I_{OUT} \times f}{I_{DRIVE}}$$

Where:  $C_{RSS}$  is the Reverse transfer capacitance of FET  $I_{DRIVE}$  is the Peak current of gate

(4) ESR Dissipation of Capacitor : Pd(ESR)

 $Pd(ESR) = I_{RMS}^{2} \times ESR$ Where:  $I_{RMS}$  is the ripple current of capacitor ESR is the equivalent series resistance

(5) Operating Current Dissipation of IC: Pd(IC)  $Pd(IC) = V_{IN} \times I_{CC}$ 

Where:  $I_{CC}$  is the circuit current

#### 5. Consideration on Permissible Dissipation and Heat Generation

Since this IC functions with high efficiency without significant heat generation in most applications, no special consideration is needed on permissible dissipation or heat generation. In case of extreme conditions, however, including lower input voltage, higher output voltage, heavier load, and/or higher temperature, the permissible dissipation and/or heat generation must be carefully considered.

For dissipation, only conduction losses due to DC resistance of inductor and ON-Resistance of FET are considered. This is because the conduction losses are most significant among other dissipation factors mentioned above such as gate charge/discharge dissipation and switching dissipation.

P=0.8<sup>2</sup>x(0.15+0.316) ≈298[mV]

$$P = I_{OUT}^{2} \times R_{ON}$$
$$R_{ON} = D \times R_{ONP} + (1 - D)R_{ONN}$$

Where:

*D* is the ON duty (= $V_{OUT}/V_{cc}$ )  $R_{ONP}$  is the ON-Resistance of P-Channel MOS FET  $R_{ONN}$  is the ON-Resistance of N-Channel MOS FET  $I_{OUT}$  is the Output Current

Since R<sub>ONP</sub> is greater than R<sub>ONN</sub> in this IC, the dissipation increases as the ON duty becomes higher. Taking into consideration the dissipation mentioned above, thermal design must be carried out with allowable sufficient margin.

## 6. Selection of Components Externally Connected

(1) Selection of Inductor (L)

Figure 26. Output Ripple Current

The inductance significantly depends on output ripple current. As seen in equation (1), the ripple current decreases as the inductor and/or switching frequency increases.

$$\Delta I_L = \frac{(V_{CC} - V_{OUT}) \times V_{OUT}}{L \times V_{CC} \times f} \qquad [A] \qquad \cdot \quad \cdot \quad \cdot \quad (1)$$

Appropriate ripple current at output should be 30% of the maximum output current.

$$\Delta I_L = 0.3 \times I_{OUTMax} \qquad [A] \cdot \cdot \cdot (2)$$
$$L = \frac{(V_{CC} - V_{OUT}) \times V_{OUT}}{\Delta I_L \times V_{CC} \times f} \qquad [H] \cdot \cdot \cdot (3)$$

 $\Delta I_L$  is the Output ripple current, and *f* is the Switching frequency

Note: Current exceeding the current rating of the inductor results in magnetic saturation of the inductor, which decreases efficiency. The inductor must be carefully selected allowing sufficient margin in which the peak current will not exceed its current rating. If V<sub>CC</sub>=5V, V<sub>OUT</sub>=3.3V, f=1MHz, ΔI<sub>L</sub>=0.3x0.8A=0.24A, for example

$$L = \frac{(5.0 - 3.3) \times 3.3}{0.24 \times 5.0 \times 1M} = 4.675 \mu \to 4.7 \qquad [\mu H]$$

Note: Select an inductor with low resistance component (such as DCR and ACR) to minimize dissipation in the inductor for better efficiency.

#### (2) Selection of output capacitor (CO)

Figure 27. Output Capacitor

Output capacitor should be selected with the consideration on the stability region and the equivalent series resistance required to minimize ripple voltage. Output ripple voltage is determined by the equation (4) :

$$\Delta V_{OUT} = \Delta I_L \times ESR \qquad \begin{bmatrix} V \end{bmatrix} \cdots (4)$$

Where:

 $\Delta I_L$  is the Output ripple current, and *ESR* is the Equivalent series resistance of output capacitor

Note: The rating of the capacitor should be determined by allowing sufficient margin against output voltage. Less ESR allows reduction in output ripple voltage.

Since the output rise time is designed to fall within the soft-start time, the capacitance of output capacitor should be determined by the requirements of equation (5):

$$C_O \leq \frac{t_{SS} \times (I_{LIMIT} - I_{OUT})}{V_{OUT}} \qquad \dots \qquad (5)$$

where:

 $t_{SS}$ : Soft-start time  $I_{LIMIT}$ : Over current detection level, 2A (Typ)

In case of BD8967FVM, for instance, and if V\_{OUT}=3.3V, I\_{OUT}=0.8A, and t\_{SS}=1ms,

$$C_O \le \frac{1m \times (2 - 0.8)}{3.3} \approx 364 \qquad \left[\mu F\right]$$

Rating of the capacitor should be determined to allow a sufficient margin against output voltage. A 10  $\mu$ F to 100  $\mu$ F ceramic capacitor is recommended.

#### (3) Selection of input capacitor ( $C_{IN}$ )

Figure 28. Input Capacitor

Input capacitor must be a low ESR capacitor that is sufficient enough to cope with high ripple current to prevent high transient voltage. The ripple current  $I_{RMS}$  is given by the equation (6):

$$I_{RMS} = I_{OUT} \times \frac{\sqrt{V_{OUT}(V_{CC} - V_{OUT})}}{V_{CC}} \qquad [A] \quad \cdot \quad \cdot \quad (6)$$

< Worst case > I<sub>RMSMax</sub>

When V<sub>CC</sub> is twice the V<sub>OUT</sub>,  $I_{RMS} = \frac{I_{OUT}}{2}$ 

If V<sub>CC</sub>=5.0V, V<sub>OUT</sub>=3.3V, and I<sub>OUTMax</sub>=0.8A

$$I_{RMS} = 0.8 \times \frac{\sqrt{3.3(5.0 - 3.3)}}{5.0} \approx 0.38 \qquad [A_{RMS}]$$

A low ESR 10µF/10V ceramic capacitor is recommended to reduce ESR dissipation of input capacitor for better efficiency.

# **BD8967FVM**

(4) Calculating RITH, CITH for Phase Compensation

Since the Current Mode Control is designed to limit an inductor current, a pole (phase lag) appears in the low frequency area due to a CR filter consisting of a output capacitor and a load resistance, while a zero (phase lead) appears in the high frequency area due to the output capacitor and its ESR. Therefore, the phases are easily compensated by adding a zero to the power amplifier output with C and R as described below to cancel a pole at the power amplifier.

 $fp = \frac{1}{2\pi \times R_O \times C_O}$  $f_{Z(ESR)} = \frac{1}{2\pi \times ESR \times C_{O}}$ 

Pole at power amplifier

When the output current decreases, the load resistance Ro increases and the pole frequency decreases.

$$fp_{(Min)} = \frac{1}{2\pi \times R_{OMax} \times C_O} \qquad [Hz] \leftarrow with \ lighter \ load$$

$$fp_{(Max)} = \frac{1}{2\pi \times R_{OMin} \times C_O}$$
 [Hz]  $\leftarrow$  with heavier load

Zero at power amplifier

Increasing the capacitance of the output capacitor lowers the pole frequency while the zero frequency does not change. (This is because when the capacitance is doubled, the capacitor ESR is reduced to half.)

$$f_{Z(Amp)} = \frac{1}{2\pi \times R_{ITH} \times C_{ITH}}$$

Figure 30. Error Amp Phase Compensation Characteristics

Figure 31. Typical Application

Stable feedback loop may be achieved by canceling the pole fp (Min) produced by the output capacitor and the load resistance with CR zero correction by the error amplifier.

$$f_{Z(Amp)} = f_{P(Min)}$$

$$\rightarrow \frac{1}{2\pi \times R_{ITH} \times C_{ITH}} = \frac{1}{2\pi \times R_{OMax} \times C_{O}}$$

# 7. Cautions on PC Board Layout

- ① For the sections drawn with heavy line, use thick conductor pattern as short as possible.
- ② Layout the input ceramic capacitor C<sub>IN</sub> near the PVCC and PGND pins, and the output capacitor C<sub>0</sub> near the PGND pin.
- ③ Layout CITH and RITH between the pins ITH and GND as close as possible with least necessary wiring.

## 8. Recommended Components Lists on Above Application

Symbol	Part	Value	Manufacturer	Series
L	Inductor	4.7µH	Sumida	CMD6D11B
C <sub>IN</sub>	Ceramic capacitor	10µF	Kyocera	CM316X5R106M10A
Co	Ceramic capacitor	10µF	Kyocera	CM316X5R106M10A
CITH	Ceramic capacitor	330pF	murata	GRM18series
RITH	Resistor	51kΩ	ROHM	MCR10 5102

Note: The parts list presented above is an example of recommended parts. Although the parts are standard, actual circuit characteristics should be checked on your application carefully before use. Be sure to allow sufficient margins to accommodate variations between external devices and this IC when employing the depicted circuit with other circuit constants modified. Both static and transient characteristics should be considered in establishing these margins. When switching noise is significant and may affect the system, a low pass filter should be inserted between the VCC and PVCC pins, and a Schottky Barrier Diode established between the SW and PGND pins.

# I/O Equivalent Circuit

Figure 33. I/O Equivalent Circuit

## **Operational Notes**

## 1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

## 2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

## 3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

### 4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

### 5. Thermal Consideration

Should by any chance the power dissipation rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the Pd rating.

### 6. Recommended Operating Conditions

These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

### 7. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

## 8. Operation Under Strong Electromagnetic Field

Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

#### 9. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

## 10. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

## **Operational Notes – continued**

#### 11. Unused Input Pins

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

### 12. Regarding the Input Pin of the IC

This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode. When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

Figure 34. Example of monolithic IC structure

## 13. Thermal Shutdown Circuit(TSD)

This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's power dissipation rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF all output pins. When the Tj falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

#### 14. Selection of Inductor

It is recommended to use an inductor with a series resistance element (DCR)  $0.1\Omega$  or less. Especially, note that use of a high DCR inductor will cause an inductor loss, resulting in decreased output voltage. Should this condition continue for a specified period (soft start time + timer latch time), output short circuit protection will be activated and output will be latched OFF. When using an inductor over  $0.1\Omega$ , be careful to ensure adequate margins for variation between external devices and this IC, including transient as well as static characteristics. Furthermore, in any case, it is recommended to start up the output with EN after supply voltage is within.

#### Precaution on using ROHM Products

1. Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment <sup>(Note 1)</sup>, transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

,			
JAPAN	USA	EU	CHINA
CLASSⅢ		CLASS II b	
CLASSⅣ	CLASSII	CLASSⅢ	CLASSII

- 2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
  - [a] Installation of protection circuits or other protective devices to improve system safety
  - [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- 3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:
  - [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
  - [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
  - [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
  - [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
  - [f] Sealing or coating our Products with resin or other coating materials
  - [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
  - [h] Use of the Products in places subject to dew condensation
- 4. The Products are not subject to radiation-proof design.
- 5. Please verify and confirm characteristics of the final or mounted products in using the Products.
- 6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- 7. De-rate Power Dissipation (Pd) depending on Ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.
- 8. Confirm that operation temperature is within the specified range described in the product specification.
- 9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

#### Precaution for Mounting / Circuit board design

- 1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- 2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

#### **Precautions Regarding Application Examples and External Circuits**

- 1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
- 2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

#### **Precaution for Electrostatic**

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of lonizer, friction prevention and temperature / humidity control).

#### **Precaution for Storage / Transportation**

- 1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
  - [a] the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
  - [b] the temperature or humidity exceeds those recommended by ROHM
  - [c] the Products are exposed to direct sunshine or condensation
  - [d] the Products are exposed to high Electrostatic
- 2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
- 3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
